

RAMOS, NICK DANIEL B.
BSCS-2A

Java file handling uses the **java.io** package, relying on the **File** class for path/metadata management and stream classes (**FileWriter**, **FileReader**, or **Scanner**) for reading and writing data.

Example: Creating a File

```
import java.io.File;
import java.io.IOException;

public class CreateFileExample {
    public static void main(String[] args) {
        try {
            File myObj = new File("filename.txt");
            if (myObj.createNewFile()) {
                System.out.println("File created: " + myObj.getName());
            } else {
                System.out.println("File already exists.");
            }
        } catch (IOException e) {
            System.out.println("An error occurred.");
            e.printStackTrace();
        }
    }
}
```
